

# Environmental Policy

ArcelorMittal

ArcelorMittal Long Products Canada, with its position as the largest recycler of scrap metal reused locally in its Quebec steel mills, recognizes that the environment and sustainable development are an integral part of its values. The company wishes to be recognized as a responsible steel producer, from its initial production to its transformation in its rolling mills and wire drawing plants.

Aware of its responsibilities as a member of the community and in line with its strategic planning which puts forward the reduction of its environmental footprint, ArcelorMittal Long Products Canada makes the following commitments to its stakeholders:

## ENVIRONMENTAL COMPLIANCE

- Implement measures and controls to comply with applicable laws, regulations and other requirements and take appropriate actions to continuously improve its environmental performance.

## EVALUATION AND MANAGEMENT REPORTING

- Conduct environment compliance audits of its activities and facilities and report to its management on the status and evolution of the company's environmental performance as well as the improvement / risk management actions to be carried out.

## STAKEHOLDER RELATIONS

- Ensure good relations with local community members by minimizing the impact of its activities on them and by setting up structures for information and continuous exchange.

## CIRCULAR ECONOMY

- Since steel can be recycled indefinitely, continue to use scrap metal as a raw material to help produce recycled steel in order to reduce the environmental footprint of its products.
- Continue to work towards circular economy principles by capturing as many opportunities as possible to reduce the industrial waste generated by its activities and by transforming it, when possible, into co-products that can be reused by other industrial players.

## RESPONSIBLE MANAGEMENT OF RESOURCES AND GHG REDUCTION

- Make optimal use of natural resources and the various energy sources required for its production in order to preserve resources and reduce greenhouse gas (GHG) emissions, with an aspiration towards total carbon neutrality by 2050 as advocated by the ArcelorMittal Group and the Government of Canada.
- Encourage research and development, and eventually the deployment of innovative technologies to produce steel in a more responsible manner, by continuously reducing the environmental footprint inherent in steel production processes.

## TRAINING AND AWARENESS

- Implement environmental management and job training programs for its employees at all levels.
- Promote environmental responsibility among stakeholders and partners (employees, suppliers, contractors) by sharing information on sound environmental management to them and by providing specific training as required.

## CONTROL MEASURES

- Maintain an environmental management system in its plants that includes objectives and programs aimed at continuously improving its environmental performance, reducing its environmental footprint and responding promptly and appropriately to any environmental emergency.
